# Joined Relations

- ▶ Join operations take two relations and return as a result another relation.
- ▶ A join operation is a Cartesian product which requires that tuples in the two relations match (under some condition). It also specifies the attributes that are present in the result of the join.
- ▶ The join operations are typically used as subquery expressions in the from clause.
- ▶ Three types of joins:
  - ▶ Natural join
  - ▶ Inner join
  - ▶ Outer join

# Natural Join in SQL

- ▶ Natural join matches tuples with the same values for all common attributes, and retains only one copy of each common column.
- ▶ List the names of instructors along with the course ID of the courses that they taught.

```
1      SELECT
2          name, course_id
3      FROM
4          students, takes
5      WHERE
6          student.ID = takes.ID;
```

# Natural Join in SQL

- ▶ Same query in SQL with “natural join” construct.

```
1  SELECT
2      name, course_id
3  FROM
4      student NATURAL JOIN takes;
```

## Natural Join in SQL (Cont.)

- ▶ The FROM clause in can have multiple relations combined using natural join:

```
SELECT  $A_1, A_2, \dots, A_n$   
FROM  $r_1$   
      NATURAL JOIN  $r_2$   
      NATURAL JOIN  $\dots$   
      NATURAL JOIN  $r_n$   
WHERE  $P$ ;
```
