

# Best-case analysis

*(For intuition only!)*

If we're lucky, PARTITION splits the array evenly:

$$\begin{aligned} T(n) &= 2T(n/2) + \Theta(n) \\ &= \Theta(n \lg n) \quad (\text{same as merge sort}) \end{aligned}$$

What if the split is always  $\frac{1}{10} : \frac{9}{10}$ ?

$$T(n) = T\left(\frac{1}{10}n\right) + T\left(\frac{9}{10}n\right) + \Theta(n)$$

What is the solution to this recurrence?
