

Database Administration

Lecture 04: ERD Reverse Design.

Udemy and Visual Paradigm.

17 de febrero de 2025

Database Administration: Reverse Design.

Udemy Explorar Buscar cualquier cosa

Desarrollo > Diseño y desarrollo de bases de datos > Sistemas de gestión de bases de datos (DBMS)

The screenshot shows a course page on Udemy. At the top, there's a navigation bar with the Udemy logo, search bar, and account links. Below it, the course title 'Database Design and Management' is displayed with a subtitle 'Learn how to design and manage database with ERD, database generation and reversal with Visual Paradigm.' A thumbnail image shows a central blue cylinder with four smaller orange cylinders connected to it, labeled 'Vista previa de este curso'. Below the thumbnail, there are tabs for 'Lo que aprenderás', 'Contenido del curso' (which is selected), 'Valoraciones', and 'Instructores'. The 'Requisitos' section lists 'Basic software development concept' and 'PC or OSX or Linux'. The 'Contenido del curso' section shows a table of contents with 4 sections: 'Introduction to Database Design and Management' (8 classes, 1h 31 min), 'Database Engineering' (3 classes, 37 min), 'Java Database Programming' (1 classes, 17 min), and 'Best Practices' (2 classes, 17 min). There are also links to 'Ampliar todas las secciones' and 'Ir al curso'.

Sección	Clases	Duración
Introduction to Database Design and Management	8 clases	1 h 31 min
Database Engineering	3 clases	37 min
Java Database Programming	1 clases	17 min
Best Practices	2 clases	17 min

Content has been extracted from *Database Design and Management*. Udemy Course, created by Visual Paradigm, 2025. Visit <https://www.udemy.com/course/database-design-and-management/> and <https://www.visual-paradigm.com/>.

Entity and Column

Generalizing entity from data

The diagram illustrates the process of generalizing a database entity from raw data. On the left, a table with 9 rows and 5 columns is shown. The columns are labeled: Photo ID, Photo Title, Uploader Name, Uploader PhoneNum, and Uploader Address. The first two columns (Photo ID and Photo Title) are highlighted with a red border, indicating they are being abstracted into a new entity. Two red arrows point downwards from these two columns towards the right side of the diagram. To the right, a large orange rounded rectangle represents the generalized entity. It contains three sections: a top section labeled "Photo", a middle section labeled "ID", and a bottom section labeled "Title".

Primary Key

Key and Relationship

Primary key is a table column
(or columns) which **uniquely** identifies
each record in a table.

Key and Relationship

What is Primary Key?

Member Name	Member PhoneNum	Member Address
Nancy Ward	620-824-6226	213 Cotton Valley

Key and Relationship

Primary key could be a single column or
a group of columns.

Key and Relationship

When you define more than one column as a primary key, it's called a **composite primary key**.

Key and Relationship

Composite PK Example

Photo ID	Member ID	Shared Date
1	1	3/3/2015
1	2	3/4/2015
1	3	3/5/2015
2	1	3/6/2015
2	4	3/7/2015
3	1	3/2/2015
3	5	3/3/2015

Table: Photo_Sharing

Key and Relationship

Primary Key Assignment

Values of a primary key can be assigned by the following ways

Auto-Generated

Specify Manually

Sequence

Key and Relationship

Primary Key Assignment

Auto-Generated

- Allows a unique value to be generated when you insert a new record into a table.

ID
1
2
3
+ 4

Key and Relationship

Primary Key Assignment

Specify Manually

- Provide a unique value when you insert a new record into a table.
- The value is mandatory (cannot be unfilled/null)
- Examples:
 - Social Security Number (SSN)
 - Email address
 - ISBN

SSN
751-15-2261
122-21-7421
693-86-0582
+ 830-27-5782

Key and Relationship

Primary Key Assignment

Sequence

- Allows a unique value to be generated when you insert a new record into a table.
- The **interval**, **min value**, **max value** and **sequence** of value can be defined.
- Example:

ID
5
10
15
+ 20

Key and Relationship

Ascending Sequence

MINVALUE:

1

MAXVALUE: 99999999

START WITH: 1

INCREMENT BY: 3

CACHE: 20

The number of sequence values to be stored in memory for faster access.

2	Wanda A. Allison	808-839-2217	2017 Green Impasse

Database table: Member

Foreign Key Column

Key and Relationship

Understanding Foreign Key

The diagram illustrates a database relationship between two tables: **Photo** and **Member**.

Database table: Photo

ID	Title	Member ID
1	The tram	1
2	Little kitten	1
3	Chamomile	1
4	New bus route	2
5	Ferry pier 9	1
6	The coast	1
7	Rock climbing	2
8	Fountain	1
9	Sunset	2

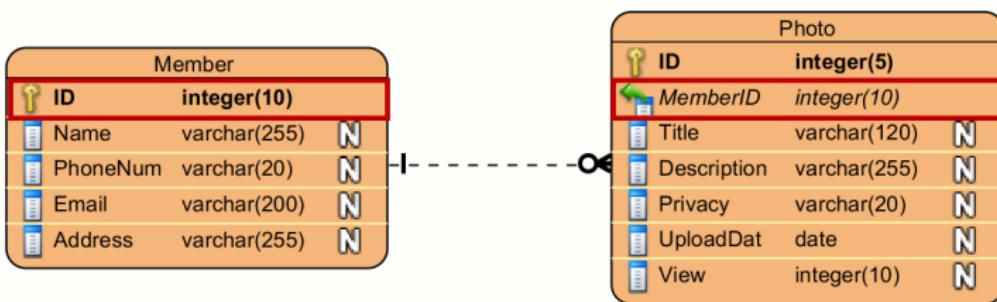

Database table: Member

ID	Name	PhoneNum	Address
1	Chris Wong	252-608-5628	572 Lost Lake Crossing
2	Wanda A. Allison	808-839-2217	2017 Green Impasse

A red callout bubble points to the 'Member ID' column in the **Photo** table, containing the value '1'. It contains the text: "Uniquely identifies a member in the Member table".

Key and Relationship

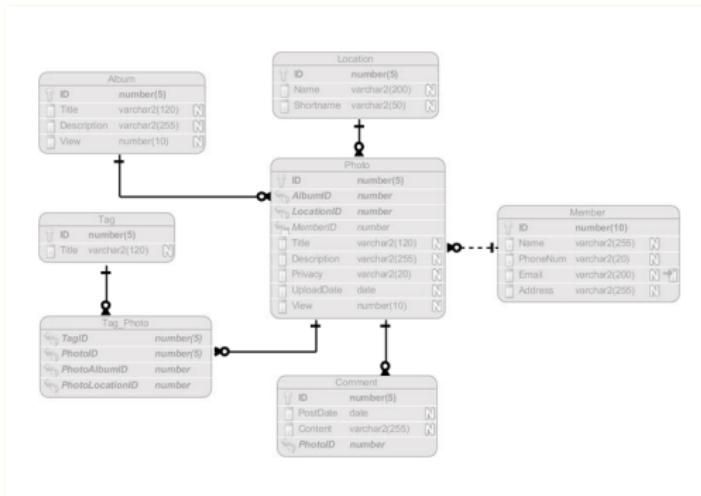

Presentation of Foreign Key

The use of foreign key in Photo entity (Referencing the **primary key** of Member entity)

Key and Relationship

Relationship and cardinality

Key and Relationship

Relationship and cardinality

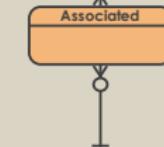

Common cardinality types:

1 to many

1 to 0..1

Many to Many

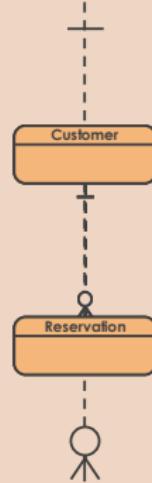

Key and Relationship

Relationship and cardinality

1 to Many

- Used when a record in a table can reference multiple records in another table.
 - Examples
 - A **Member** can upload many **Photos**
 - A **Customer** can make many **Reservations**
 - A **Document** can have many **Revisions**
- Probably the most common type of cardinality

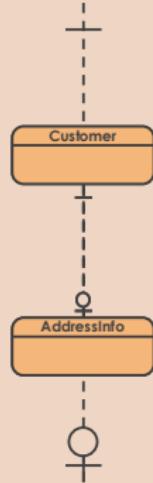

Key and Relationship

Relationship and cardinality

■ 1 to 0..1

- Used when a record in a table can reference up to one record in another table.
 - Examples
 - A **BlogPost** can have a single piece of blog **Content**
 - A **Customer** can have one set of **AddressInfo**
- You gain performance due to:
 - Separating less commonly used data into another table.
- You lose performance due to:
 - More tables lead to more table overhead and disc storage.
 - Complicated queries resulted by additional JOIN clause.
- Conclusion:
 - If there are data that you don't access in >90% of your use cases (or you don't have that data in most of the time), then it would be a wise choice to separate these data into another table for better performance.

Key and Relationship

Relationship and cardinality

Many to Many

- Broken down into a pair of one-to-many relationships.
- Associative entity is used to define the association between two related entities
- Used when a record in a parent table can reference multiple records in another table. At the same time, a record in a child table can also reference multiple records in the parent table.
 - Examples
 - A **Student** can enroll in many **Courses**, while a **Course** can be taken by many **Students**
 - An **Order** can consist of many **Products**, while a **Product** can appear in many **Orders**.

Key and Relationship

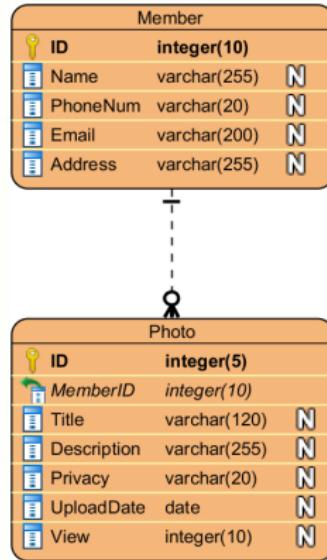

Foreign Key Example

A Member
can upload
many Photos

Key and Relationship

Foreign Key Example

Key and Relationship

Foreign Key Example

A **BlogPost** can have a single piece of blog Content

Key and Relationship

Foreign Key Example

The screenshot shows a web application window titled "My Blog". The main content area displays a blog post with the title "This is a blog post". The post content is a long paragraph of placeholder text (Lorem ipsum). To the right of the main content is a sidebar containing two sections: one with three small square icons and another with four horizontal bars.

BlogPost		
key	ID	integer(10)
file	Title	varchar(100)
file	Summary	varchar(100)
file	PostDate	date
file	Status	char(5)
file	ShortName	varchar(20)

A vertical dashed line with a plus sign at the bottom connects the "BlogPost" table to the "Content" table, indicating a relationship. The "Content" table is shown below.

Content		
key	ID	integer(10)
file	BlogPostID	integer(10)
file	content	clob

Key and Relationship

Foreign Key Example

A **Photo** can have many **Tags**.

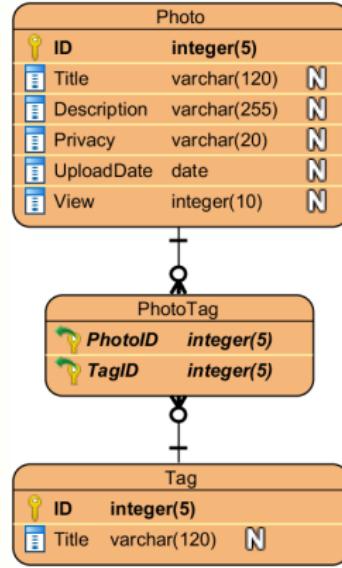

A **Tag** can be used by many **Photos**.

Key and Relationship

Foreign Key Example

hongkong → pier → ferry pier
ferry → central → building
nine →

PhoneNum : varchar	(20)
Email : varchar	(200)
Address : varchar	(255)

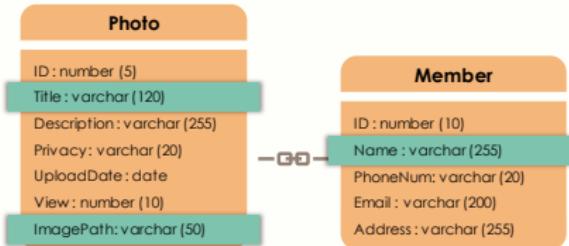

<<View>>

Browse_Photo_View

Database View

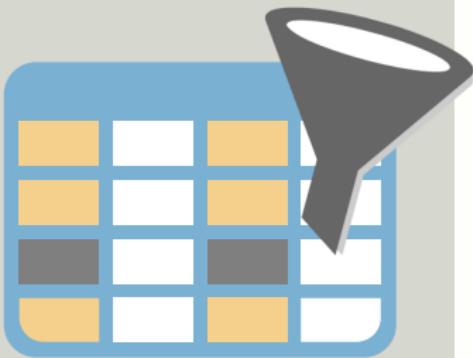

Concept of Joining Tables

A view with columns from multiple tables

Database View

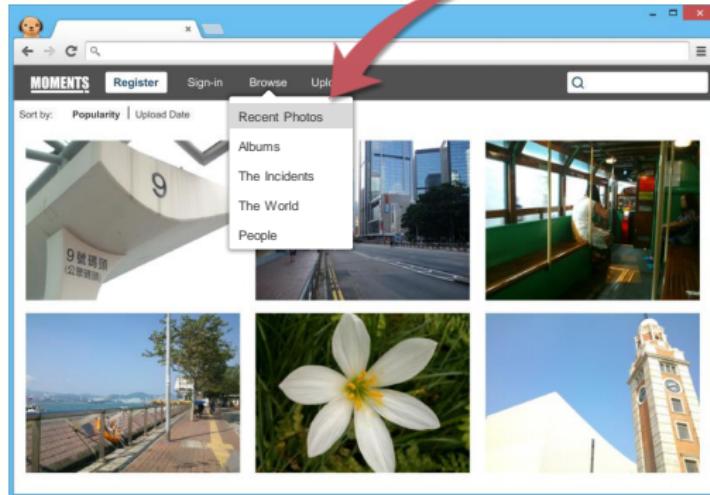

You can apply **Filter** to ensure
that only relevant data is
stored in the result set

Database View

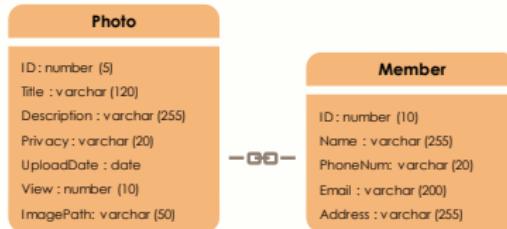

Concept of Filter

How about a view that lists
only recent photos' data?

Database View

Concept of Filter

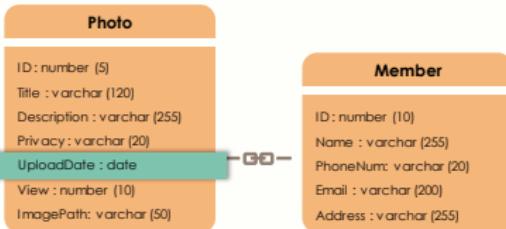

A view that contains both photo and member data.

Database View

Concept of Filter

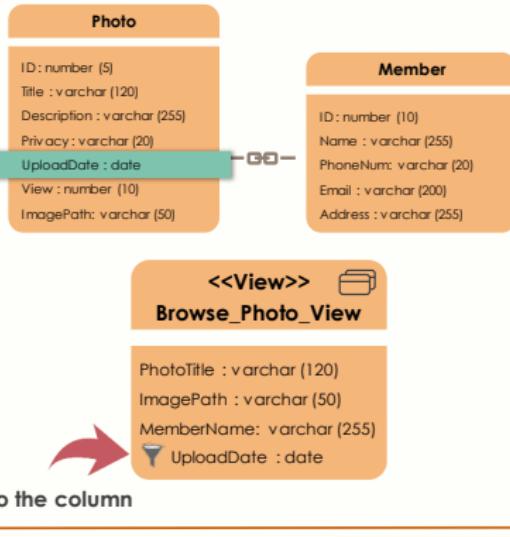

To list out only the recent photos, we need the help of the **UploadDate** column.

Database View

Concept of Filter

Entities and Columns

The Three Levels of E-R Models

Key and Relationships

Database Views

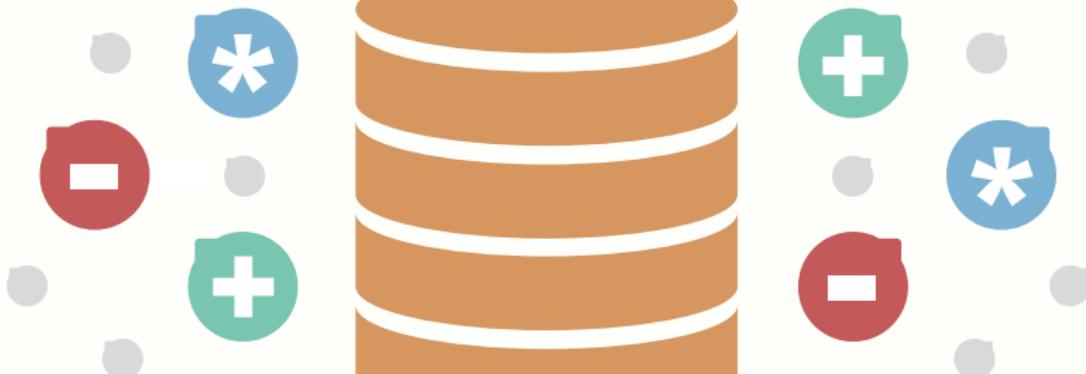

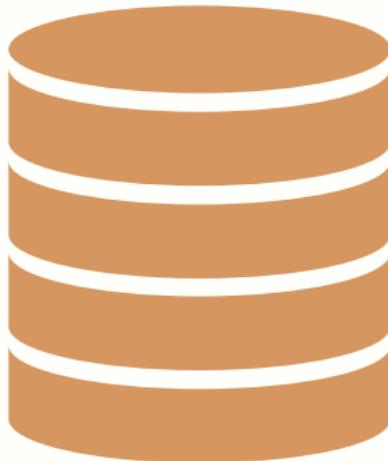

Triggers and Stored Procedures

A database trigger is a procedure that is automatically executed in response to certain events on a database table

Triggers and Stored Procedures

Sample Usage - Auditing

As the system runs, you keep modifying the data in database...

Triggers and Stored Procedures

Sample Usage - Auditing

Who modified the price
of milk to \$320?

When did he/she do it?

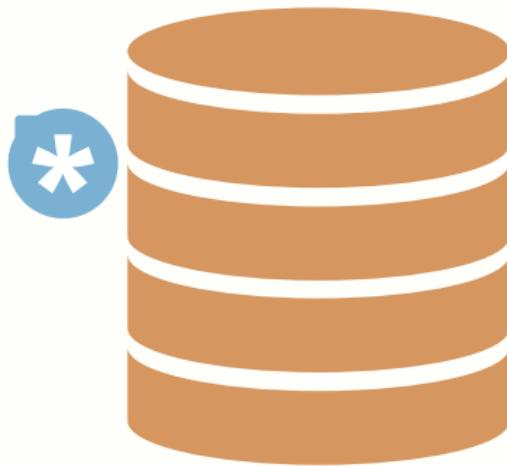

What was the value before the
change?
...

Product	Price
Biscuit	10
Bread	8
Milk	320
Sugar	6

For business reasons, you may want to know the answer of these questions.

Triggers and Stored Procedures

Sample Usage - Auditing

Trigger can be used to audit your database. Let's say if someone is trying to update a record

Triggers and Stored Procedures

Sample Usage - Auditing

Type	UserName	Time	Old_Val	New_Val
U	WG\Peter	2/5/...	8	320

If you have written a trigger for auditing, it can help you log his action before writing data into DB

Triggers and Stored Procedures

A stored procedure is a pre-written procedure code that allows you to execute over and over again for validation or quick retrieval of data.

Triggers and Stored Procedures

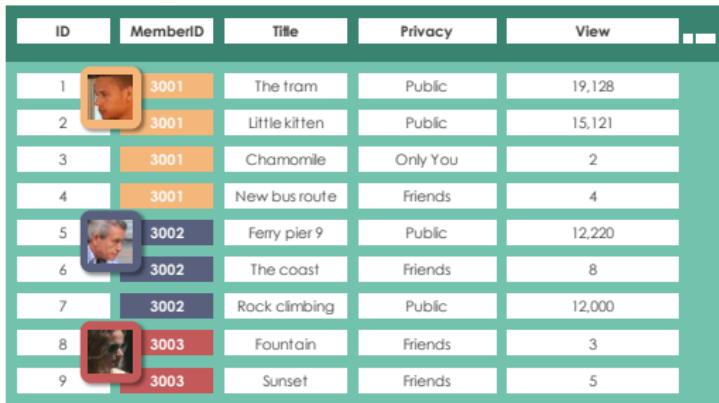

Sample Usage – Querying Data

ID	MemberID	Title	Privacy	View
1	3001	The tram	Public	19,128
2	3001	Little kitten	Public	15,121
3	3001	Chamomile	Only You	2
4	3001	New bus route	Friends	4
5	3002	Ferry pier 9	Public	12,220
6	3002	The coast	Friends	8
7	3002	Rock climbing	Public	12,000
8	3003	Fountain	Friends	3
9	3003	Sunset	Friends	5

Let's take a look at this table. This is the **Photo** table, with all photos listed.

Triggers and Stored Procedures

Sample Usage – Querying Data

A screenshot of a database query results table. The table has columns: ID, MemberID, Title, Privacy, and View. There are 9 rows of data. Row 1 shows a photo of a man (MemberID 3001). Row 5 shows a photo of a man (MemberID 3002). Row 8 shows a photo of a woman (MemberID 3003). The MemberID column uses color coding: orange for row 1, blue for row 5, and red for row 8.

ID	MemberID	Title	Privacy	View
1	3001	The tram	Public	19,128
2	3001	Little kitten	Public	15,121
3	3001	Chamomile	Only You	2
4	3001	New bus route	Friends	4
5	3002	Ferry pier 9	Public	12,220
6	3002	The coast	Friends	8
7	3002	Rock climbing	Public	12,000
8	3003	Fountain	Friends	3
9	3003	Sunset	Friends	5

These photos are uploaded by different members, identified by their IDs.

Triggers and Stored Procedures

Sample Usage – Querying Data

ID	MemberID	Title	Privacy	View
1	3001	The tram	Public	19,128
2	3001	Little kitten	Public	15,121
3	3001	Chamomile	Only You	2
4	3001	New bus route	Friends	4
5	3002	Ferry pier 9	Public	12,220
6	3002	The coast	Friends	8
7	3002	Rock climbing	Public	12,000
8	3003	Fountain	Friends	3
9	3003	Sunset	Friends	5

The photos have different levels of privacy – public, only you (private) and friends.

Triggers and Stored Procedures

Sample Usage – Querying Data

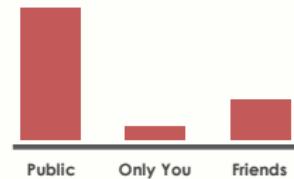

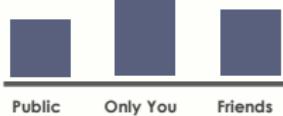

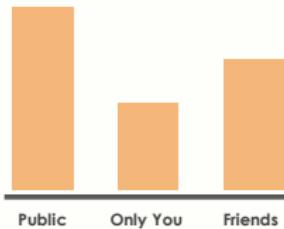

ID	MemberID	Title	Privacy	View
1	3001	The tram	Public	19,128
2	3001	Little kitten	Public	15,121
3	3001	Chamomile	Only You	2
4	3001	New bus route	Friends	4
5	3002	Ferry pier 9	Public	12,220
6	3002	The coast	Friends	8
7	3002	Rock climbing	Public	12,000
8	3003	Fountain	Friends	3
9	3003	Sunset	Friends	5

and the number of view for each photo is stored in the View column.

[Triggers and Stored Procedures](#)

Sample Usage – Querying Data

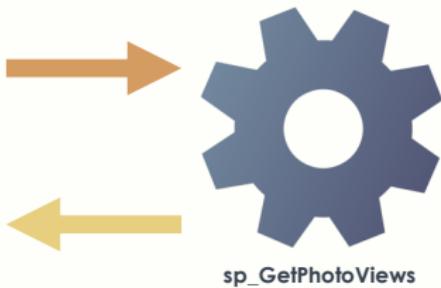

Photo view count

If now you want to retrieve the photo view count of different members, categorized by the privacy of photo...

Triggers and Stored Procedures

Sample Usage – Querying Data

MemberID	Public_Count	Only_You_Count	Friend_Count
3001	34249	2	4
3002	24220	0	8
3003	0	0	8
⋮			

You can write a procedure to return the resultset you need. By executing the procedure you will get the data you need easily.

Triggers and Stored Procedures

Creating a Procedure

```
CREATE PROCEDURE sp_GetPhotoViews()
BEGIN
    DECLARE v_member_id int;
    DECLARE v_pub_photo_viewcount int DEFAULT 0;
    DECLARE v_pri_photo_viewcount int DEFAULT 0;
    DECLARE v_frd_photo_viewcount int DEFAULT 0;
    DECLARE v_member_cursor CURSOR FOR SELECT ID, 'Name' FROM Member;

    CREATE TEMPORARY TABLE member_photo_viewcount (member_id int, public_photo_viewcount int, private_photo_viewcount int, friends_photo_viewcount int);

    OPEN v_member_cursor;

    FETCH v_member_cursor into v_member_id;
    BEGIN
        SELECT SUM('View') INTO v_pub_photo_viewcount FROM Photo WHERE Privacy = 'Public' AND MemberID = v_member_id;
        SELECT SUM('View') INTO v_pri_photo_viewcount FROM Photo WHERE Privacy = 'Only You' AND MemberID = v_member_id;
        SELECT SUM('View') INTO v_frd_photo_viewcount FROM Photo WHERE Privacy = 'Friends' AND MemberID = v_member_id;

        INSERT INTO member_photo_viewcount VALUES (v_member_id, v_pub_photo_viewcount, v_pri_photo_viewcount, v_frd_photo_viewcount);
        FETCH v_member_cursor into v_member_id;
    END;

    CLOSE v_member_cursor;

    SELECT * FROM member_photo_viewcount;
    DROP TABLE member_photo_viewcount;
END
```

Triggers and Stored Procedures

End of Lecture 4.
