

EDT - Lab02: A ‘gentle’ Introduction to Remote Sensing Indices.

			1	2	3	4	5	6	7
Criteria	Description	Points							
Data Acquisition & Preprocessing	Successfully downloads the correct pre- and post-flood Landsat scenes (late Jan & mid-Feb 2026); properly performs raster clipping to delimit the affected study area in QGIS.	10							
Band Composites (True & False Color)	Flawlessly generates both True Color and False Color composites (NIR-based) for pre- and post-flood events, clearly differentiating water bodies from vegetation.	15							
Spectral Indices (NDVI & NDWI)	Correctly calculates both NDVI and NDWI via map algebra for pre- and post-flood conditions; raster symbology/pseudocolor palettes effectively emphasize flood impact.	25							
Temporal Analysis & Interpretation	Provides an insightful, accurate comparative analysis of vegetation health and flooded areas between the "before" and "after" periods; effectively quantifies/evaluates environmental impact.	15							
Cartographic Design & Report Formatting	Produces professional "before and after" map layouts in QGIS with complete elements (north arrow, scale bar, legend, clear title); submits a well-structured PDF on time.	10							
Defense	Oral defense of the lab work, demonstrating technical mastery over the topics: Band composites, Spectral indices and Temporal analysis.	25
