D B A

DBA - Final Project: Final Defense.

Criteria	Description	Points	1	2	3	4	5	6
Data Modeling & Schema Design	The schema is perfectly optimized for geospatial entities. Choice of NoSQL model is fully justified for scale and flexible spatial querying.	5						
PDET Municipality Boundaries Dataset Integration	MGN 2025 dataset successfully acquired, verified, and strictly filtered to target PDET jurisdictions without geometry errors.	8						
Building Footprint Data Loading & Integration Report	Bulk-loading strategies are utilized efficiently. Spatial indexes (e.g., 2dsphere, R-Tree) are cleanly implemented to handle massive scale.	12						
Accuracy of Spatial Operations	Point-in-polygon/intersect queries accurately count buildings and aggregate total rooftop areas per municipality. Handling of overlapping regions is flawless.	8						
Reproducibility & Methodology	Code is perfectly clean, modular, parameterized, and fully reproducible from the repository with zero manual interventions.	12						
Output Structure & Map Visualizations	Clean, structured output tables coupled with intuitive maps that clearly delineate rooftop distribution across target jurisdictions.	15						
Content, Completeness & Visuals	Comprehensive synthesis tracking the entire workflow. Highly polished visual data representations (charts, comparative maps).	15						
Defense	The randomly selected team member demonstrates absolute mastery over the entire engineering and analytical process.	25						
	Total:	100
