

EDT

EDT - Lab03: A 'gentle' Introduction to Satellite Imagery Classification.

			1	2	3	4	5	6	7
Criteria	Description	Points							
Data Acquisition & Supervised Classification	Download the required Sentinel-2 bands (Blue, Green, Red, NIR) from the Copernicus Data Space Ecosystem, execute the supervised classification workflow using the Semi-Automatic Classification Plugin (SCP) in QGIS, and thoroughly document each geoprocessing step.	20							
Thematic Map Layout	Design a professional-quality cartographic layout visualizing the resulting land-cover classification map, including standard map elements (legend, scale bar, north arrow, grid).	10							
Accuracy Assessment: Theoretical Summary	Read Section 7.17 of Lillesand et al. (2015) and provide a concise, clear summary of classification accuracy assessment and error matrix methodologies, including clear photos of handwritten notes embedded as figures.	25							
Quality of Writing	Ensure clarity, logical flow, correct use of remote sensing terminology (e.g., spectral bands, supervised classification, error matrix), and professional formatting throughout the narrative.	10							
Report Structure and Delivery	Submit a well-structured technical report in PDF format via Brightspace before the 14-day deadline, properly embedding all required maps and summary images.	10							
Defense	Oral defense of the lab work, highlighting the training sample selection, classification methodology, accuracy assessment concepts, and final results.	25							
Total:		100
